FileMaker Pro 6 Developer's Guide to XML, XSL, Word

In the realm of database development and data management, integrating FileMaker Pro 6 with XML, XSL, and Microsoft Word offers powerful capabilities for data exchange, reporting, and automation. This guide aims to provide developers with a comprehensive understanding of how to leverage these technologies to enhance their FileMaker Pro 6 applications. Whether you are looking to export data into structured formats, transform XML data with XSLT, or generate Word documents dynamically, this guide covers the essential concepts, best practices, and step-by-step instructions.

Understanding the Foundation: FileMaker Pro 6 and XML

What is XML and Why Use It with FileMaker?

XML (Extensible Markup Language) is a versatile markup language designed for storing and transporting data in a structured, human-readable format. Its hierarchical nature makes it ideal for representing complex data structures, which can then be shared across different systems.

Using XML with FileMaker Pro 6 allows for:

- Data import/export in standardized formats
- Data interchange between FileMaker and other applications
- Facilitating data transformation and reporting workflows

Exporting Data from FileMaker Pro 6 as XML

To export data as XML:

- Open your FileMaker database and navigate to the layout containing the data you want to export.
- Choose **File > Save Records As > XML**.
- Specify the filename and location for the XML file.
- Define the XML schema if needed, or use default settings.
- Click **Save** to generate the XML file.

Tip: You can create custom XML schemas to organize your data more precisely.

Transforming XML Data Using XSLT

Introduction to XSL and XSLT

XSL (eXtensible Stylesheet Language) is a family of recommendations for defining XML document presentation. XSLT (XSL Transformations) is a language for transforming XML documents into other XML documents, HTML, or text.

In FileMaker Pro 6, you can utilize external tools or scripting to apply XSLT transformations to your XML data, enabling:

- Customized report generation
- Data reformatting for specific applications
- Seamless integration with web services or other systems

Applying XSLT to XML Data

Since FileMaker Pro 6 does not natively support XSLT processing, developers typically:

- Export data as XML from FileMaker
- Use external command-line tools or scripts (like xsltproc or MSXML) to transform the XML using an XSL stylesheet
- Import the transformed data back into FileMaker or export it for other uses

Example Workflow:

- Create an XSL stylesheet to define how XML data should be transformed.
- Automate the transformation process via scripts or third-party tools.
- Import or utilize the transformed data as needed.

Tip: Automate the entire process with FileMaker scripts that invoke external tools using the "Perform AppleScript" or "Perform Shell Script" steps.

Generating Word Documents from FileMaker Data

Why Generate Word Documents?

Automatically creating Word documents from your database data can streamline reporting, client communication, and documentation tasks, saving time and reducing errors.

Methods to Create Word Documents

Since FileMaker Pro 6 does not have native support for Word document creation, developers can use several approaches:

- Export data as Rich Text Format (RTF) or HTML, then open in Word and save as DOC/DOCX
- Use scripting to generate Word-compatible XML or HTML files that Word can interpret
- Leverage external automation tools like AppleScript (on Mac) or COM automation (on Windows) to control Word directly

Using RTF for Word Document Generation

RTF is a document file format supported by Word that can be generated programmatically:

- Design an RTF template with placeholders for data
- Use FileMaker scripts to replace placeholders with actual data
- Export the resulting RTF file and open it in Word for final editing or distribution

Example steps:

- Create an RTF template with merge fields.
- Populate fields via FileMaker scripts.
- Export as RTF and open in Word for formatting and final touches.

Tip: Automate this process with AppleScript or Windows Script Host for seamless document creation.

Integrating FileMaker Pro 6 with Word and Other Office Applications

Automating Word with FileMaker

On Windows, COM (Component Object Model) automation allows FileMaker to control Word directly:

- Open Word application object
- Create new documents or modify existing templates
- Insert data into specific bookmarks or placeholders
- Save and close documents programmatically

Sample Workflow:

- Use FileMaker's "Perform AppleScript" (on Mac) or "Perform JavaScript" / "Perform Windows Script" (on Windows) steps.
- Write scripts to automate Word actions, such as inserting data, applying styles, and saving documents.

Benefits of Office Automation

- Reduces manual data entry errors
- Accelerates report generation
- Ensures consistency across documents

Best Practices and Tips for Developers

- Always validate your XML data with schemas to ensure correctness before transformation.
- Maintain clear separation between data, transformation stylesheets, and presentation templates.
- Test external scripts and automation thoroughly to prevent errors during batch processing.
- Keep your workflows modular, allowing easy updates to stylesheets or templates without affecting core data processes.
- Leverage existing tools and libraries for XML and Word automation to streamline development.

Security Considerations

- Be cautious when executing external scripts or automation to prevent security vulnerabilities.
- Validate all data inputs to prevent injection attacks or corrupt files.
- Use secure file handling practices, especially when dealing with sensitive data.

Conclusion

Integrating FileMaker Pro 6 with XML, XSL, and Word unlocks a wide array of capabilities for data management, transformation, and reporting. While FileMaker's built-in features provide a solid

foundation for exporting and importing XML data, leveraging external tools and automation enhances functionality further. By understanding the principles of XML and XSLT, and applying automation techniques for Word document generation, developers can create sophisticated, efficient, and highly automated workflows that meet diverse business needs.

Embarking on this integration journey requires careful planning, testing, and adherence to best practices, but the payoff in improved productivity and data consistency can be substantial. With the strategies outlined in this guide, you are well-equipped to harness the full potential of FileMaker Pro 6 in conjunction with XML, XSL, and Word.

FILEMAKER 12 DEVELOPERS REFERENCE FUNCTIONS SCRIPT

FileMaker 12 Developers Reference Functions Script

FileMaker 12 remains a powerful platform for building custom database solutions, offering a comprehensive set of tools for developers to create robust, user-friendly applications. One of the core strengths of FileMaker 12 is its scripting engine combined with a rich library of functions that enable automation, data manipulation, and dynamic interface control. For developers, understanding and effectively utilizing the FileMaker 12 Developers Reference Functions Script is crucial for leveraging the full potential of the platform.

This article provides an in-depth overview of FileMaker 12's scripting functions, how they are referenced, and best practices for implementing scripts in your database solutions. Whether you're a seasoned developer or just beginning, mastering these references will improve your efficiency and the quality of your applications.

Understanding FileMaker 12 Developer Functions and Scripts

FileMaker 12 introduces a flexible scripting environment that allows developers to automate tasks, validate data, navigate records, and manipulate data objects seamlessly. At the heart of this environment are functions?predefined operations that perform specific tasks and can be called within scripts or calculations.

Key Concepts Include:

- Functions: Built-in commands that perform specific operations, such as string manipulation, date calculations, or logical evaluations.
- Scripts: Sequences of steps that can include calling functions, performing operations, and controlling application flow.
- References: The way scripts and functions are documented and called within FileMaker, including syntax, parameters, and behavior.

Understanding the structure of reference functions and how they interact enables developers to write more efficient, maintainable, and error-resistant scripts.

Core Components of FileMaker 12 Developer Reference Functions Script

1. Function Syntax and Structure

Every function in FileMaker 12 follows a consistent syntax:

```
```plaintext
```

```
FunctionName (parameter1 ; parameter2 ; ...)
```

```
```
```

- Function Name: The specific operation, such as `Get ( CurrentDate )` or `Substitute ( text ; search ; replace )`.
- Parameters: Inputs that modify the behavior of the function; separated by semicolons.

Example:

```
```plaintext
```

```
Left ("Hello World" ; 5)
```

```
```
```

Returns: `Hello`

Best Practice: Always consult the official FileMaker 12 Developer Reference for precise syntax and parameters for each function.

2. Categories of Functions

FileMaker 12 offers functions categorized into various groups, including:

- String functions: `Left`, `Right`, `Substitute`, `Trim`
- Date and Time functions: `Get ( CurrentDate )`, `Date ( Year ; Month ; Day )`
- Logical functions: `If`, `Case`, `And`, `Or`, `Not`
- Math functions: `Abs`, `Ceiling`, `Floor`, `Mod`
- Summary functions: `Sum`, `Count`, `Average`
- Related Record functions: `RelatedRecord`, `ExecuteSQL`
- Container functions: `GetContainerAttribute`, `Insert From Device`
- User Interface functions: `Show Custom Dialog`, `Refresh Window`

Familiarity with these categories helps in selecting the right functions for specific scripting needs.

Using Reference Functions in Scripts

3. Writing Effective Scripts with Functions

Scripts in FileMaker 12 are composed of script steps, many of which invoke functions directly or conditionally. Here are common patterns:

- Data validation: Using `IsEmpty`, `Get ( LastError )`, or `PatternCount`.
- Data manipulation: Using `Substitute`, `Left`, `Right`, `Middle`, `Trim`.
- Conditional logic: Using `If`, `Case`, and combining with logical functions like `And`, `Or`.
- Navigation: Using `Go to Layout`, `Go to Record/Request/Page`, with functions to determine where to go.

Example Script Snippet:

```
```plaintext
```

```
If [IsEmpty (YourTable::Name)]
```

```
Show Custom Dialog ["Error" ; "Name field cannot be be empty."]
```

```
Exit Script []
```

```
End If
```

```
Set Field [YourTable::FullName ; Trim (YourTable::Name)]
```

```

```

In this example, the `IsEmpty`, `Show Custom Dialog`, and `Trim` functions are used effectively within the script to validate and clean data.

## 4. Referencing Functions in Calculations

Functions are also used within calculation fields, auto-enter calculations, and script steps that evaluate expressions.

Best Practices:

- Use `Get ( CurrentDate )` to automatically populate date fields.
- Use `Evaluate ( "Your calculation here" )` when dynamic evaluation is needed.
- Use `Let` functions to improve calculation clarity and efficiency.

## Advanced Scripting Techniques with Functions

### 5. Combining Functions for Complex Logic

Often, simple functions are combined to perform complex operations. For example:

```
```plaintext
```

```
Case (
```

```
Get ( CurrentTime ) ? Time ( 17 ; 0 ; 0 ) ; "Evening" ;
```

```
Get ( CurrentTime ) ? Time ( 12 ; 0 ; 0 ) ; "Afternoon" ;
```

```
"Morning"
```

```
)
```

```
---
```

This script determines the time of day based on the current time.

6. Error Handling with Functions

Proper error handling is critical. Use `Get ( LastError )` and functions like `If`, `Try`, and `Case` to manage unexpected situations:

```
```plaintext
```

```
Set Error Capture [On]
```

```
Perform Find [YourTable::ID = "123"]
```

```
If [Get (LastError) ? 0]
```

```
Show Custom Dialog ["Error" ; "Record not found."]
```

```
Exit Script []
```

```
End If
```

```
```
```

This comprehensive guide aims to demystify the core concepts, key functions, and best practices associated with scripting in FileMaker 12, empowering developers to harness the full potential of this robust platform.

Introduction to FileMaker 12 Scripting Environment

FileMaker 12 introduced a powerful scripting engine that allows developers to automate tasks, manipulate data, control user interface flow, and integrate with external systems seamlessly. The scripting environment is built around a rich set of functions?each designed to perform specific operations?organized within the context of scripts that can be triggered manually, on a schedule, or

through user interactions.

Understanding the FileMaker 12 Developers Reference Functions Script means familiarizing oneself with the available functions, their syntax, and appropriate use cases. This guide will walk through essential aspects, including functions, data manipulation, conditional logic, error handling, and best practices for script development.

The Core of FileMaker 12 Functions: An Overview

FileMaker functions are categorized into various groups based on their purpose:

- Data functions (e.g., Get, Set, Replace)
- Logical functions (e.g., If, Case, While)
- Summary and aggregate functions (e.g., Sum, Count)
- Date and time functions (e.g., Get(CurrentDate))
- External data functions (e.g., ExecuteSQL)
- User interface functions (e.g., Show Custom Dialog)

Mastering these functions enables developers to write scripts that are both powerful and maintainable.

Building Blocks: Basic Scripting Concepts

Before diving into specific functions, it's important to understand the foundational concepts:

Script Steps and Logic

Scripts are composed of script steps that execute in sequence. Each step performs a task, such as opening a window, setting a variable, or performing a find.

Variables and Data Storage

- Local variables (Set Variable) are used for temporary data within a script.
- Global variables (Set Variable with \$\$ prefix) persist across sessions until explicitly cleared.
- Fields are used for persistent data stored within the database.

Error Handling

Robust scripts include error checking, typically via Get (LastError) to handle unexpected

conditions gracefully.

Key Functions in FileMaker 12 Scripts

Below are some of the most essential functions in the FileMaker 12 Developers Reference for scripting:

- Data Retrieval and Manipulation

- Get () Functions:

- `Get ( CurrentDate )` ? retrieves the current date.
- `Get ( CurrentTime )` ? retrieves the current time.
- `Get ( UserName )` ? gets the current user?s login name.
- `Get ( ScriptParameter )` ? retrieves data passed to a script.

- Set Field:

- `Set Field [ Table::Field ; Value ]` ? assigns a value to a field.

- Replace Field Contents:

- `Replace Field Contents [ Table::Field ; Calculation ]` ? replaces data in a field with the result of a calculation.

- Conditional Logic and Control Flow

- If / Else / End If:

- Implements decision-making logic based on conditions.

- Case:

- Handles multiple conditions efficiently.
- While (introduced in later versions; for FileMaker 12, use recursion or loop structures):
- Looping constructs can be simulated with recursive scripts or using `Loop` and `Exit Loop If`.

- Looping and Repetition

- Loop / Exit Loop If / End Loop:

- Repeats script steps until a condition is met.

- Error Handling Functions

- Get (LastError):
 - Checks the outcome of the previous script step.
- Set Error Capture [On] / [Off]:
 - Controls whether FileMaker captures script errors to prevent dialog prompts.

- External and SQL Functions

- ExecuteSQL:
 - Executes SQL queries within FileMaker:

...

ExecuteSQL ("SELECT Field FROM Table WHERE Condition" ; "" ; "")

...

- Enables powerful data retrieval capabilities beyond traditional find commands.

Practical Application: Building a Sample Script

Scenario: Automate Record Validation and Notification

Suppose you want to create a script that validates input data, updates records accordingly, and notifies the user of success or errors.

Step 1: Initialize variables

- Set variables for data validation.

Step 2: Validate data

- Use `If` conditions to check for required fields.

Step 3: Update records

- Use `Set Field` to update data.

Step 4: Error handling

- Use `Get ( LastError )` to verify success.

Step 5: Notify user

- Use `Show Custom Dialog` to inform of success or errors.

Sample script outline:

```
...

Set Variable [ $recordID ; Value: Table::ID ]

Set Variable [ $newStatus ; Value: "Approved" ]

If [ IsEmpty ( Table::ApprovalNotes ) ]

Show Custom Dialog [ "Validation Error" ; "Approval notes must be provided." ]

Exit Script []

End If

Set Field [ Table::Status ; $newStatus ]

Commit Records/Requests

If [ Get ( LastError ) ? 0 ]

Show Custom Dialog [ "Error" ; "Failed to update record." ]

Else
```

```
Show Custom Dialog [ "Success" ; "Record approved successfully." ]
```

```
End If
```

```
...
```

This example demonstrates core scripting techniques, including variable management, conditional logic, data manipulation, and error handling.

Advanced Techniques for FileMaker 12 Developers

Using Looping and Recursion

While FileMaker 12 does not natively support `While`, scripting can be achieved with `Loop` and `Exit Loop If`:

```
...
```

```
Loop
```

```
Exit Loop If [ Condition ]
```

```
// Perform repeated actions
```

```
End Loop
```

```
...
```

Performing Complex Data Retrieval with ExecuteSQL

SQL queries are invaluable for complex data operations:

```
...
```

```
// Count number of overdue invoices
```

```
Set Variable [ $overdueCount ; Value: ExecuteSQL (
```

```
"SELECT COUNT() FROM Invoices WHERE DueDate  
"" ; "" ;
```

```
Get ( CurrentDate ) ; "Paid" )
```

```
]
```

```
...
```

Dynamic Script Execution

Using `Perform Script` with parameters allows scripts to be dynamic and reusable:

```
...
```

```
Perform Script [ ?ProcessRecord? ; Parameter: $recordID ]
```

```
...
```

Within `ProcessRecord`, retrieve the parameter:

```
...
```

```
Set Variable [ $recordID ; Value: Get ( ScriptParameter ) ]
```

```
...
```

Best Practices for FileMaker 12 Script Development

- Comment thoroughly: Use `` to annotate complex logic.
- Modularize scripts: Break complex processes into smaller, reusable scripts.
- Handle errors gracefully: Always check `Get ( LastError )` after critical steps.
- Optimize data access: Use SQL queries where appropriate to improve performance.
- Use variables wisely: Minimize global variables unless necessary.
