- Use the Zone Editor to create, edit, and validate zones

3. Demand Modeling

Demand modeling estimates travel flows:

- Trip Generation: Estimating trips produced and attracted by zones
- Trip Distribution: Assigning trips between zones
- Mode Choice: Distributing trips across different modes (car, transit, cycling, walking)
- Assignment: Routing trips through the network

The tutorial guides you through setting up these steps using Visum's demand modules.

4. Network Assignment and Calibration

- Assign trips to the network using various algorithms (all-or-nothing, incremental)
- Calibrate the model by adjusting parameters to match observed data
- Use performance measures like volume-to-capacity ratios and travel times

5. Scenario Development and Analysis

Visum enables scenario comparison:

- Create different scenarios (e.g., new transit line, road closure)
- Run simulations for each scenario
- Analyze impacts on traffic, congestion, and accessibility

6. Visualization and Reporting

- Generate maps, charts, and tables
- Export reports for stakeholders
- Use visualization tools for presentations

Deep Dive into Key Workflow Steps

Building the Network Model

To start modeling, you'll need to build a detailed and accurate network:

- Import GIS Data: Use shapefiles, CAD files, or other GIS formats

- Define Network Attributes: Set speed limits, capacities, costs
- Create Transit Networks: Define routes, schedules, stops
- Validate Network Topology: Ensure connectivity and correctness

Demand Estimation Techniques

Demand modeling is central to Visum:

- Utilize external data sources (census, surveys)
- Apply trip generation models based on land use
- Use gravity models for trip distribution
- Incorporate mode choice models using multinomial logit or nested logit models

Assignment Methods

Visum offers various assignment techniques:

- All-or-Nothing Assignment: Simplest, assigns all trips to the shortest path
- Incremental Assignment: Distributes trips over multiple iterations for realism
- User Equilibrium: Balances trip distribution considering congestion

Choose the appropriate method based on the model's purpose.

Model Calibration and Validation

Calibration ensures the model reflects real-world conditions:

- Compare model outputs with observed traffic counts
- Adjust parameters like impedance functions and mode shares
- Use goodness-of-fit measures to assess accuracy

Validation involves testing the model against independent data sets.
